-i- FUNCTION: POTENT MICROBICIDAL ACTIVITY, ACTIVE AGAINST
-i- STAPHYLOCOCCUS AUREUS AND ESCHERICHIA COLI.

-i- TISSUE SPECIFICITY: LARGE GRANULES OF NEUTROPHILS.
-i- PTM: ELASTASE MIGHT BE RESPONSIBLE FOR ITS MATURATION.
-i- SIMILARITY: BELONGS TO THE CATHELLCIDIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Selsted M.E., Novotny M.J., Morris W.L.,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CORI_MOUSE Q9Z319;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               J. BIOCHEM. 124.784.789(1998).

J. BIOCHEM. 124.784.789(1998).

I. FUNCTION: CONVERTS PRO-ANP TO ANP. CLEAVES PRO-ANP S. BETWEEN ARG-122 AND SER-123 (BY SIMILARITY).

SUBCELLULIAR LOCATION: Type II membrane protein.

I. TISSUE SPECIFICITY: HIGHLY EXPRESSED IN HEART.

I. SIMILARITY: DELONGS TO PEPTIDASE FAMILY S1.

I. SIMILARITY: CONTAINS 7 LDL-RECEPTOR CLASS A DOMAINS.

I. SIMILARITY: CONTAINS 2 FRIZZLED (FZ) DOMAINS.

I. SIMILARITY: CONTAINS 1 SRCR DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This SWISS-PROT entry is copyright. "Cloning of a higher-plant plastid omega-6 fatty acid desaturase cDNA and its expression in a cyanobacterium."; plant physiol. 105:635-641(1994).

-i- FUNCTION: CHLOROPLAST OMEGA-6 FATTY ACID DESATURASE INTRODUCES THE SECOND DOUBLEBOND IN THE BIOSYNTHESIS OF 16:3 AND 18:3 FATTY ACIDS, IMPORTANT CONSTITUENTS OF PLANT MEMBRANES. IT IS THOUGHT TO USE FERREDOXIN AS AN ELECTRON DONOR AND TO ACT ON FATTY ACIDS ESTERIFIED TO GALACTOLIPIDS, SULFOLIPIDS AND PHOSPHATIDYLGLYCEROL.
-i- PATHWAY: POlyunsaturated fatty acid biosynthesis.
                                                                                                                                                                                                                                    Glycine max (Soybean).
